

How to Make Coffee:

Packets of coffee grounds are pre-measured and are located in cupboard under coffee machine (both regular and decaf, read packet for details) along with coffee filters.

- Turn coffee machine to "ON/LOWER"
- Place filter in brew pan
- Pour coffee in filter (make sure filter is upright and not tipped)
- Press "Brew" once and only once, wait 1 min. to see if it starts brewing (water is automatically pumped into the machine)

NOTE: be sure to let put completely finish brewing before removing the pot. The first of the brew is VERY strong and the last of the brew is very light so the whole pot needs to be together to make the right combination of flavor.
